## **Physiologic Anchorage Control**

This book provides a comprehensive introduction to physiologic anchorage control, explains the implications for clinical practice, and presents an anchorage technique applicable for the treatment of different malocclusions. The concept of physiologic anchorage control is derived from observations of upper molar movement during growth in adolescence, including in the absence of orthodontic treatment, which indicate that molar forward displacement comprises two components: the first due to biologic force or physiologic anchorage loss and the second due to orthodontic force or mechanical anchorage loss. All previous anchorage methods have been based on the assumption that molar anchorage loss is to be attributed solely to the mechanical force used to retract anterior teeth, and the new concept represents a paradigm shift of clinical significance. This book explores the pattern of upper molar growth in depth, highlights the physiologic significance of the curve of Spee, and analyzes the biomechanics of physiologic anchorage control. An anchorage control system that fully takes into account the latest conceptual insights is described and its clinical use and utility, examined.

Roads Into and Out of Chinatown is the story of Dr. Annie Chin Siu, a pioneer Chinese American woman orthodontist. Annie describes her early years in an immigrant family with 7 children in San Francisco's Chinatown in the 1930's and 40's. Through hard work, perseverance, and emphasis on education, the family improved their social position. Their lives were difficult growing up in Chinatown but the family worked together and supported each other. Annie Siu is a trailblazer. She was the only woman in the University of California San Francisco Dental School 1950 freshman class, and the first Chinese woman in the dental school ever. Unable to find someone who would hire a Chinese American orthodontist, she opened her own office in Alhambra. While maintaining her successful practice, she raised four daughters. Annie and her lifetime partner, Tim Siu, developed a giving spirit. Both of them became community leaders in many local and Chinese American organizations. Her lifelong commitment and dedication to her community has positively impacted the lives of many people. Annie's commitment to hard work is exemplified by the writing of this book. She knew she had a story to tell and she learned the skills to tell this story with care, humor, and wisdom. Annie is a pioneer in so many ways; she is an inspiration to all of us.

Within recent years, in the course of increasing international exchanges in the field of Health Sciences, many questions on various aspects of its development in China during the past three decades have been asked by visiting colleagues from abroad, particularly on the development and practice of health care in China. It has been felt that since most of the medical publications have been in Chinese, a language inaccessible to the majority of professionals in other countries, a brief review of the clinical and practical aspects of health care in China written in both Chinese and English would be of service in introducing medical practice in China to the medical profession at home and abroad. The present volume is the result of collaborative efforts by specialists in the respective disciplines in clinical medicine of Sichuan Medical College, Chongqing Medical College, Shandong Medical College and Nanjing Medical College. Obviously, such an undertaking entailed the review of large quantities of publications of China and the contributors are to be congratulated for having successfully completed the selection of appropriate materials included in this space-limited volume.

This dissertation, "Functional Appliance Therapy and Upper Airway Dimensions" by Min, Gu, ??, was obtained from The University of Hong Kong (Pokfulam, Hong Kong) and is being sold pursuant to Creative Commons: Attribution 3.0 Hong Kong License. The content of this dissertation has not been altered in any way. We have altered the formatting in order to facilitate the ease of printing and reading of the dissertation. All rights not granted by the above license are retained by the author. Abstract: The aim of this study was to investigate the effects of functional appliance therapy on the upper airway dimensions of Chinese children. Firstly, associations between craniofacial characteristics and daytime sleepiness (a symptom of sleep disordered breathing [SDB]) were identified in an orthodontic clinic. The extra- and intra-oral craniofacial characteristics, and a self-completed Paediatric Daytime Sleepiness Scale were recorded in a group of 265 Chinese adolescents aged 11-17 years. The data demonstrated that a bilateral Class II molar relationship, increased overjet, hypertrophic tonsils and a relatively large tongue were positively associated with daytime sleepiness. The results implied that Class II malocclusion was a risk factor of SDB. Secondly, to derive upper airway cephalometric norms for Chinese children, lateral cephalograms of 425 randomly selected 12-year-old Chinese children from 10 schools in Hong Kong were used to establish sex-specific cephalometric norms for the upper airway. Ethnic and age differences were determined by comparing the norms with the results of 108 12-year-old Caucasian children and 74 Chinese adults, respectively. Thirdly, a retrospective study was conducted to investigate the effects of Herbst appliance therapy on the upper airway of different sexes. Pre- and post-treatment lateral cephalograms from 44 Herbst-treated adolescents were analysed. Longitudinal cephalometric data of 34 untreated adolescents were used as growth data for comparison. The results indicated that Herbst appliance therapy enlarged the upper airway dimensions at two different levels for girls and boys with Class II malocclusion. For girls, it was the retroglossal oropharynx, and for boys, it was the hypopharynx. The boys displayed a significantly greater increase in the anterior and posterior facial heights than the girls, potentially accounting for the level dissimilarities. Furthermore, the Herbst appliance improved the inclination of the soft palate and restricted growth of the nasopharynx in both the boys and girls. Finally, a randomised controlled trial was carried out to investigate changes in the upper airway dimensions and the sleep-related breathing disordered (SRBD) scale following functional appliance therapy. Twenty-six adolescents with Class II malocclusion were randomised to receive either Herbst or Twin Block appliance therapy. Lateral cephalograms, magnetic resonance imaging, and parents-completed 22-item SRBD scale were obtained at baseline and after functional appliance treatment. The results indicated that increases in upper airway dimensions - width, depth and area - were observed for most parameters and several reached statistical significance by one year of combined growth and functional appliance therapy. In addition,

improvements in sleep-related behaviour were evident and significantly correlated with airway dimension changes. The significant difference between the effects of the Herbst and Twin Block appliances was only significant in lower anterior facial height, but not in upper airway structures. In conclusion, the results demonstrated that Class II malocclusion is associated with the paediatric SDB; and that both Herbst and Twin Block appliance therapies can increase the upper airway dimensions and improve the sleep-related breathing. Essential Orthodontics is a comprehensive introduction to the biological principles of orthodontics. This book covers the why, when and how of orthodontics, enabling readers to identify which individuals need to be treated, to diagnose based on individual dentofacial development, and to understand the mechanical principles and tissue responses involved. Divided into three parts, this authoritative resource covers pretreatment considerations, treatment principles of skeletal and dentoalveolar anomalies, and tissue response to orthodontic and orthopaedic forces. Classification of malocclusions and craniofacial growth and development are discussed, and the text explores how to distinguish between normal occlusion and malocclusions. Essential Orthodontics outlines how to perform a comprehensive orthodontic examination leading to an orthodontic diagnosis, and the formation of a treatment plan. Following a student-friendly layout with key objectives and chapter summaries, Essential Orthodontics is an accessible yet comprehensive resource for both undergraduate and postgraduate dental students.
