Photographs of many species are illustrated in colour for the first time. The guide includes helpful hints on bird-watching and bird photography. There is a useful bibliography, list of best bird-watching sites and an island by island check list of species recently observed, all included to help the visitor get the best out of bird-watching in the islands.

This guide covers the Greater Antilles, which comprises five groups of islands and six countries. From Cuba, with about 360 species, to the Cayman Islands with just over 220 species, the Greater Antilles have recorded just over 550 species and this total contains more than 100 single island endemics and many more restricted range species making these islands a very attractive proposition to the visiting birder. The site accounts have details of location, birding strategy, accommodation and, of course, the birds. More than 80 sites are detailed, many with accompanying maps. A full species lists shows exactly what has been seen in each country, and the selective list helps to target the best places to visit. As well as covering the very best birding sites, the authors have also tried to include some locations close to main holiday centres used by birders with families.

PUERTO RICO BIRDS.

Many species of plants that produce fleshy fruits depend on birds for seed dispersal, and many of the birds that disperse seeds rely on fruits for a substantial proportion of their diets. From an ecological and evolutionary standpoint, it is important to understand why frugivorous birds feed in the particular plants they do. Intrinsic plant characteristics (e.g., crop size) influence the foraging patterns of birds; however, these factors cannot be fully understood outside the context of the communities within which birds and plants find themselves. Here I report on spatial patterns of bird use of fruiting plants in central Puerto Rico and its relationship to plant distributions and fruit abundance. From Feb.-Jun. 1998 I quantified frugivorous bird visitation to fruiting trees of *Schefflera morototoni* in a secondary forest-shade coffee plantation mosaic. Visitation rate was positively related to crop size and negatively related to conspecific fruit abundance within 30 m of focal plants. The presence or abundance of heterospecific bird-consumed fruits had mixed relationships with visitation: four species were positively related to visitation; one was negatively related. The fruit neighborhood explained most variation in visitation to focal trees, suggesting that such variables might help explain the high variability seen in other fruiting plant frugivore systems. In order to evaluate spatial dependency in tree distributions, fruiting, and frugivory over a range of tree species and spatial scales, I mapped bird-consumed fruiting plants on a 4.05 ha study grid in secondary wet forest and monitored fruiting and frugivory from Aug.-Nov. 1999. I focused analyses on four tree species: *Dendropanax arboreus*, *Guarea guidonia*, *Miconia serrulata*, and *Schefflera morototoni*. All of these were intraspecifically aggregated at scales
